1. Create a repository in git
2. Clone that repo (skeleton ) to your local pc
3. Open in code editor this cloned folder
4. Start coding
5. Once done save your code.
6. Run basic git commands to upload your code to github.

Basic git commands:

After your coding is done , you have tested ur code , follow the below steps:
1. Add the untacked files to git using :
   a. git add . (this will add all files to git)
   b. Git commit -m "enter your[sensible] commit message here"
   c. Git push -u origin <name of your branch>
      Example: Git push -u origin master
